Huntington's disease can take a long time to diagnose. It is a hereditary illness with numerous symptoms that leave a person unable to walk or talk and needing full-time care. We explain genetic ...

Huntington's disease: Symptoms, causes, and treatment

Huntington's disease (HD), also known as Huntington's chorea, is an inherited disorder that results in death of brain cells. The earliest symptoms are often subtle problems with mood or mental abilities. A general lack of coordination and an unsteady gait often follow. As the disease advances, uncoordinated, jerky body movements become more apparent. ...

Huntington's disease - Wikipedia

Overview. Huntington's disease is an inherited disease that causes the progressive breakdown (degeneration) of nerve cells in the brain. Huntington's disease has a broad impact on a person's functional abilities and usually results in movement, thinking (cognitive) and psychiatric disorders.

Huntington's disease - Symptoms and causes - Mayo Clinic

Huntington's disease (HD) is an inherited disease that causes certain nerve cells in the brain to waste away. People are born with the defective gene, but symptoms usually don't appear until middle age.
