Polynomial Representations Of GL_n

$GL(n, \mathbb{C})$ AND $GL(n, \mathbb{R})$ over equivalence classes of irreducible square integrable modulo center representations of $GL(2, \mathbb{R})$, while runs over all positive integers and $0 < \alpha < 1/2$.

$GL_n(\mathbb{C})$ and $GL_n(\mathbb{R})$ - HAZU

General linear group of a vector space. If V is a vector space over the field F , the general linear group of V , written $GL(V)$ or $Aut(V)$, is the group of all automorphisms of V , i.e. the set of all bijective linear transformations $V \rightarrow V$, together with functional composition as group operation. If V has finite dimension n , then $GL(V)$ and $GL(n, F)$ are isomorphic.

General linear group - Wikipedia

Definitions and concepts. Let V be a vector space over a field F . For instance, suppose V is \mathbb{R}^n or \mathbb{C}^n , the standard n -dimensional space of column vectors over the real or complex numbers respectively. In this case, the idea of representation theory is to do abstract algebra concretely by using $n \times n$ matrices of real or complex numbers.. There are three main sorts of algebraic objects for ...

NUMBER THEORY CONFERENCES, NEW AND OLD

The E6-E7-E8 structures are based on the Freudenthal-Tits Magic Square, which shows relationships between division algebras and matrix algebras. In particular: Division algebras define the rows of the Magic Square; Jordan algebras define the columns of the Magic Square; and Lie algebras define the entries of the Magic Square. The Jordan algebras are Hermitian matrices with a symmetric product.

Freudenthal-Tits Magic Square

We study geometric properties of GL -spaces. We demonstrate that every finite-dimensional GL -space is polyhedral; that in dimension 2 there are only two, up to isometry, GL -spaces, namely the space whose unit sphere is a square (like ℓ_∞^2 or ℓ_1^2) and the space whose unit sphere is an equilateral hexagon.
