

The Pade Approximant In Theoretical Physics

The Pade Approximant In Theoretical

In mathematics a Padé approximant is the 'best' approximation of a function by a rational function of given order - under this technique, the approximant's power series agrees with the power series of the function it is approximating. The technique was developed around 1890 by Henri Padé, but goes back to Georg Frobenius who introduced the idea and investigated the features of rational ...

Padé approximant - Wikipedia

Approximants derived by expanding a function as a ratio of two power series and determining both the numerator and denominator coefficients. Padé approximations are usually superior to Taylor series when functions contain poles, because the use of rational functions allows them to be well-represented. The Padé approximant $R_{(L/0)}$ corresponds to the Maclaurin series.

Padé Approximant -- from Wolfram MathWorld

Interpolation provides a means of estimating the function at intermediate points, such as x . We describe some methods of interpolation, differing in such properties as: accuracy, cost, number of data points needed, and smoothness of the resulting interpolant function.
