In bioinformatics, the root-mean-square deviation of atomic positions (or simply root-mean-square deviation, RMSD) is the measure of the average distance between the atoms (usually the backbone atoms) of superimposed proteins. Note that RMSD calculation can be applied to other, non-protein molecules, such as small organic molecules. In the study of globular protein conformations, one ...

Interpretation. An MSE of zero, meaning that the estimator  $\hat{\theta}$  predicts observations of the parameter with perfect accuracy, is the ideal, but is typically not possible.. Values of MSE may be used for comparative purposes. Two or more statistical models may be compared using their MSEs as a measure of how well they explain a given set of observations: An unbiased estimator

also called the (unweighted) average. Notations for "the" mean of a set of values include macron notation or  $\bar{\cdot}$ . The expectation value notation is sometimes also used. The mean of a list of data (i.e., the sample mean) is implemented as Mean[list]. In general, a mean is a homogeneous function that has the property that a mean of a set of numbers satisfies
